California

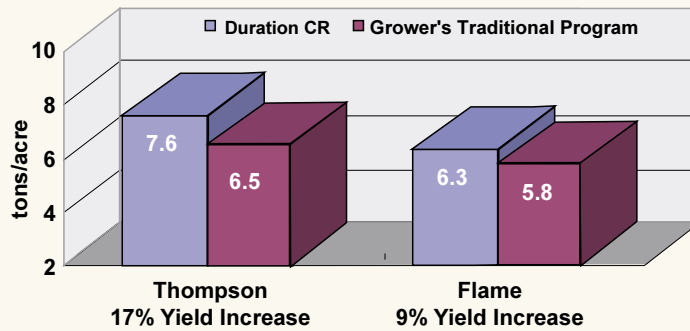

## Maximize Table Grape Performance With Duration CR™

Instead of releasing all of the fertilizer into the soil at the time of application, **Duration CR** provides a controlled release of nitrogen. **Duration CR** gives your crop the nutrients it needs precisely when it needs it - resulting in higher yields and improved quality.

## Higher Yields

Large scale field trials with **Duration CR** have shown up to a 17% yield increase, when compared to the grower's traditional fertility program.

**Table Grape Trial Summary**  
**Incremental Yield Increase with Duration CR**

Both treatments received equal amounts of nitrogen.

## The Benefits Add Up

- ☑ **Higher Yields**  
Time after time, field after field, growers are finding **Duration CR** helps produce higher yielding crops and improve profitability.
- ☑ **Reduced Number of Applications**  
With **Duration CR**, you can place more of your fertilizer in a single spring application. This saves time and the inconvenience of multiple in-season nitrogen applications.
- ☑ **Reduced Worry in Wet Conditions**  
Heavy rainfall will not leach the coated nutrients, reducing the need to apply conventional fertilizers after a period of wet weather.
- ☑ **Healthy Plants, Steady Nutrient Supply**  
The steady nutrient release contributes to healthier, high yielding grape plants.
- ☑ **Less Potential for Groundwater Contamination**  
Research has shown **Duration CR** is less susceptible to nitrate leaching, keeping nitrogen in the crop's root zone.
